Many of today's mobile devices are operated by hand or finger gestures made by touching the screen.

Smartphones have icons on the screen that must be pressed to operate. Multiple screens are accessed by swiping left or right. Tabular data is accessed by swiping or dragging up, down, left or right.

The screens that allow this type of action are almost all capacitive in nature. The bioelectricity in your hands and fingers are what make the screens move in the desired direction. Body heat is not involved in "moving," just the small electric charge your body accumulates.

One problem with this method is that moisture on your fingers tends to leave a deposit on the screen, so that repeated operation may result in some portions of the screen being slightly marred. The deposits can be removed with a clean moist cloth or other methods.

I watched a fellow typing on his tablet on the pseudo keyboard presented on the screen. I noticed that his screen was marked by fingermarks at the keys on which he was typing.

Agloves allow you to operate normally without leaving any deposits behind. If you try working with your tablet using regular gloves, they don't work because the bioelectric charge cannot be passed through the fabric of ordinary gloves. Agloves, on the other hand, do work normally because of the silver woven into the glove fabric.

These gloves are functional not just with one or two fingers, but all ten. For those of us who are touch typists, using all ten fingers is essential.

One other benefit of Agloves is their ability to operate touch-screen devices when the temperature is cold. Your fingers tend to lose their moisture when cold. The gloves aren't affected by cold and conduct your bioelectric charge even in the cold.

The gloves only come in one color, black. They are not solid black, but instead black with white interlacing. The white comes from the silver woven into the whole glove. They also keep your hands warm!

About: Agloves

Vendor: Agloves
